

Application report: Controlled negative pressure therapy with MOMOSAN white

Different tests have shown that MOMOSAN white is excellently suited for use with NPWT pumps. Contrary to MOMOSAN clima black, it works with low negative pressure (approx. 40-60 mmHG).

MOMOSAN white has a very fine surface that ensures gentle micro-stimulation of the wound surface. This may contribute to better blood circulation and remedy possible circulation disorders. The advantage of this „gentle method“ is that the low negative pressure prevents the discharge of too many minerals, proteins, nutrients, etc. with the exudate. In addition, the wound stays moist, wound healing is enforced and the cell proliferation stimulated.

**MOMOSAN**[®] white

is used to prevent the discharge of too many minerals, proteins, nutrients, etc. and keep the base of the wound moist, especially at low negative pressure (approx. 40-60 mmHG)

female, 63 years, **Right trochanter: Treatment with NPWT pump and MOMOSAN white**
& **SBH 2nd degree decubitus: Classic treatment with MOMOSAN white**

Patient:

MOMOSAN[®]
